

CHANGE LOG

- Transaction history is added in SRS.
- Detailed requirements about reports are added in SRS.
- In Inventory, a system of batches for each item, sorting, and color coding for items is added.
- Dashboard shows the number of bills generated instead of the number of customers visited.
- Some non-functional requirements have been updated. For example, we have changed the minimum password length. We have also added a few additional non functional requirements like - "Preview Bill" and "Generate Bill" options for generating PDF shouldn't take more than 6 seconds.
- Few fields in the data dictionary are updated.
- A new functionality of sending an email with an attached invoice whenever a customer makes a purchase has been added. The same is being done when a new credit user is added or when credit transactions are updated. Earlier, the SRS required just notifications. However, we were able to send mails with attached invoices for every transaction.
- Reminders about pending credit has been removed.
- Instead of printing the invoice, it is generated in PDF format and sent via email directly to the customer.
- Use Case model for Dashboard and Invoice is slightly modified.
- Class diagram has been slightly updated in the Design Document. The user ID attribute is added in all the models.
- The sequence Diagrams have also been slightly modified in the Design Document.
